

3¹⁸ Series of Encoders

Features

- Operating voltage: 2.4V~12V
- Low power and high noise immunity CMOS technology
- Low standby current
- Three words transmission

Applications

- Burglar alarm system
- Smoke and fire alarm system
- Garage door controllers
- Car door controllers

- Built-in oscillator needs only 5% resistor
- Easy interface with an RF or infrared transmission media
- Minimal external components
- Car alarm system
- Security system
- Cordless telephones
- Other remote control systems

General Description

The 3¹⁸ encoders are a series of CMOS LSIs for remote control system applications. They are capable of encoding 18 bits of information which consists of N address bits and 18–N data bits. Each address/data input is externally trinary programmable if bonded out. It is otherwise set floating internally. Various packages of the 3¹⁸ encoders offer flexible combinations of

application needs. The programmable ad-
dress/data is transmitted together with the
header bits via an RF or an infrared transmis-
sion medium upon receipt of a trigger signal.
The capability to select a TE trigger type or a
DATA trigger type further enhances the appli-
cation flexibility of the 3 ¹⁸ series of encoders.

Pin Description

Pin Name	I/O	Internal Connection	Description
A0~A11	Ι	TRANSMISSION GATE	Input pins for address A0~A11 setting They can be externally set to VDD, VSS, or left open.
AD10~AD17	Ι	TRANSMISSION GATE	Input pins for address/data (AD10~AD17) setting They can be externally set to VDD, VSS, or left open.
D12~D17	Ι	CMOS IN Pull-low	Input pins for data (D12~D17) setting and transmission enable (active high) They an be externally set to VDD or left open (see Note).
DOUT	0	CMOS OUT	Encoder data serial transmission output
LED	0	NMOS OUT	LED transmission enable indicator
TE	Ι	CMOS IN Pull-low	Transmission enable, active high (see Note).
OSC1	Ι	OSCILLATOR	Oscillator input pin
OSC2	0	OSCILLATOR	Oscillator output pin
VSS	Ι		Negative power supply (GND)
VDD	Ι		Positive power supply

Notes: D12~D17 are data input and transmission enable pins of the HT6187/HT6207/HT6247. TE is the transmission enable pin of the HT600/HT640/HT680.

Functional Description

Operation

The 3^{18} series of encoders begins a three-word transmission cycle upon receipt of a transmission enable (TE for the HT600/HT640/HT680 or D12~D17 for the HT6187/HT6207/HT6247, active high). This cycle will repeat itself as long as the transmission enable (TE or D12~D17) is held high. Once the transmission enable falls low, the encoder output completes its final cycle and then stops as shown below.

Transmission timing

Information word

An information word consists of 4 periods as shown:

Composition of information

 $\mathbf{5}$

Address/data waveform

Each programmable address/data pin can be externally set to one of the following three logic states:

Address/Data bit waveform

The "Open" state data input is interpreted as logic low by the decoders since the decoder output only have two states.

Address/data programming (preset)

The status of each address/data pin can be individually preset to logic "high", "low", or "floating". If a transmission enable signal is applied, the encoder scans and transmits the status of the 18 bits of address/data serially in the order A0 to AD17 for the HT600/HT640/HT680 and A0 to D17 for the HT6187/HT6207/HT6247.

There are some packaging limitations. The 18-pin DIP HT680, for example, offers four external data bits and eight external address bits. The remaining unpackaged bits or dummy codes are treated as floating for A0~AD17 or as pull-low for D12~D17. During an information transmission these bits are still located in their original position. But if the trigger signal is not applied, the chip only consumes a standby current which is less than 1μ A.

The address pins are usually preset to transmit data codes with particular security codes by the DIP switches or PCB wiring, while the data is selected using push buttons or electronic switches.

The following figure shows an application using the HT680:

6

Pilot	A0	A1	A2	A3	A4	A5	A6	A7	A8	A9	AD10	AD11
& Sync.	0	Z	0	1	Z	Z	1	Z	0	0	Z	Z
	AD12	AD13	AD14	AD15	AD16	AD17						
	Z	Z	Z	1	Z	Z						

The transmitted information is as shown:

Z: floating

Address/Data sequence

The following provides a table of address/data sequence for various models of the 3^{18} series encoders. A correct device should be selected according to the individual address and data requirementss.

Part No.	Address/Data Bits											
	0~3	4	5	6~9	10	11	12	13	14	15	16	17
HT600	A0~A3	A4		A6~A9		AD11	AD12	AD13	AD14	AD15		
HT640	A0~A3	A4	A5	A6~A9	AD10	AD11	AD12	AD13	AD14	AD15	AD16	AD17
HT680	A0~A3	_		A6~A9		AD11	AD12		AD14	AD15		
HT6187	A0~A3			A6~A9		A11	D12	=	D14	D15	=	=
HT6207	A0~A3	A4		A6~A9	_	A11	D12	D13	D14	D15	=	=
HT6247	A0~A3	A4	A5	A6~A9	AD10	A11	D12	D13	D14	D15	D16	D17

Notes: "—" is a dummy code which is left "open" and not bonded out.

"=" is a dummy code which is set low and not bonded out.

Transmission enable

For the TE trigger type of encoders, transmission is enabled by applying a high signal to the TE pin. But for the Data trigger type of encoders, it is enabled by applying a high signal to one of the data pins D12~D17.

7

Flowchart

8

Notes: D12~D17 are transmission enables of the HT6187/HT6207/HT6247. TE is the transmission enable of the HT600/HT640/HT680.

Oscillator frequency vs supply voltage

The recommended oscillator frequency is $f_{OSCD}\left(\text{decoder}\right)\cong f_{OSCE}\left(\text{encoder}\right).$
